AGRIUS CONVULVULI (L.) AND EUMICHTIS LICHENEA (HBN.) IN EASTBOURNE IN 1976. — I am aware of three records for Eastbourne of the Convolvulus Hawk (*A. convolvuli*) this year. The first is of a male taken on the 23rd August in an actinic 5 trap at Friston Forest (per Mr. M. Parsons). A second was collected at rest on the 1st of September at Ratton Wood (per Mr. M. Parsons). The final and third record for this species this year is of a specimen collected in the Beachy Head area, where it was attracted to light (per Dr. I. A. Watkinson).

One of Eastbourne's most local moths, the Feathered Ranunculus (*E. licheneae*), became exceedingly common this year with a total of approximately 54 specimens recorded: Rodmill Estate, 21.ix.76 (3), 25.ix.76 (4); Beachy Head, 25.ix.76 (5); King's Avenue, 19.ix.76 (4), 20.ix.76 (4), 21.ix.76 (7); 22.ix.76 (7), 26.ix.76 (2), 29.ix.76 (12), 2.x.76 (5) and 4.x.76 (1). — M. HADLEY, 7 Beverington Close, Eastbourne, Sussex.
